```
The marker protein is preferably a type A beta-lactamase, especially TEM-CC 1 beta-lactamase of Escherichia coli. The oligopeptide is a member of a CC proteome library selected from single chain antibody Fv fragment library, CC an antibody light chain variable region library and a peptide library, CC displayed within thioredoxin. The IdEA systems are useful for detecting and identifying interactions between intracellular as well as CC extracellular proteins, particularly between two or three polypeptides. CC incorporation of multiple genetic traits in a host cell. In particular, CC the systems are also useful in many applications in human therapeutics, compositics and prognostics, as well as in high-throughput screening compositive and prognostics, as well as in high-throughput screening compositive systems (e.g. E. coli Dimer Detection System, yeast two-dried system or Selective Infective Phage System) require multiple steps and compositive and phenotype, which cause severe loss of efficiency compositive and false negative rates. The present system compositive and the service in a high throughput format. The circularly permutated marker proteins comprising interaction-dependent enzymes find use in cell-based sensors for activation or compositive and in cell-based sensors for activation or compositive and in cell-based sensors for activation and between the proteomes of cells, tissues and pathogenic organisms, and in compositive and in the present sequence is Escherichia coli mature TEM-1 beta-lactamase enzyme from plasmid pBR322. TEM-1 beta-declining alpha-decay and mu

                                                                                                 밁
                                                                                                                                                                       S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a fragment complementation system (I) which comprises a first oligopeptide (OP1) containing an N-terminal CC fragment with a C-terminal break point and a second oligopeptide (OP2) fragment with a C-terminal break point and a second oligopeptide (OP2) CC comprising a C-terminal with a N-terminal breakpoint, in which the C and CC neassemble to form a functionally reconstituted MP. Methods from the CC present invention are used for monitoring the occurrence of protein (MP) and CC protein interactions in a sample, identifying oligopeptide interactions CC protein interactions in a sample, identifying epitopes that bind to an CC between two different proteomes, identifying epitopes that bind to an immunoglobulin (Ig) variable region, for identifying interactions between extracellular domain of a transmembrane protein and a polypeptide, for high-throughput identification of compounds that inhibit phosphorylation-cc regulated signal transducers, forming a enzyme complementation system for selecting simultaneous in need of it. The present sequence represents

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Db
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Š
                                                                                                             Escherichia coli beta-lactamase (AAW16634), including the signal peptide is the expression product of a molecular chimaera, designated pCMV-BL (AAT66737), in which the beta-lactamase gene is under control of the CMV intermediate/early promoter. Vectors consisting of a transcriptional regulatory DNA sequence linked to a beta-lactamase gene can be used for enzyme prodrug therapy. Expression of the beta-lactamase in a targetted cell allows conversion of a prodrug into an agent toxic to the cell for treatment of cancer, viral (e.g. HIV) infection or inflammation. Secretion of the enzyme has the advantage of increasing neighbouring cel
                                                                                     Sequence
                                                                                                                                                                                                                                                       Molecular chimaera for gene or virus directed enzyme prodrug therapy useful for treatment of cancer, viral infection or inflammation.
                                                                                                                                                                                                                                                                                                                                                                               20-NOV-1995;
